

**16 x 8 x 1 BiMOS-E Crosspoint Switch**

The Intersil CD22M3494 is an array of 128 analog switches capable of handling signals from DC to video. Because of the switch structure, input signals may swing through the total supply voltage range,  $V_{DD}$  to  $V_{EE}$ . Each of the 128 switches may be addressed via the ADDRESS input to the 7 to 128 line decoder. The state of the addressed switch is established by the signal to the DATA input. A low or zero input will open the switch, while a high logic level or a one will result in closure of the addressed switch when the STROBE input goes high from its normally low state. Any number or combination of connections may be active at one time. Each connection, however, must be made or broken individually in the manner previously described. All switches may be reset by taking the RESET input from a zero state to a one state and then returning it to its normal low state.

CS allows crosspoint array to be cascaded for matrix expansion.

**Features**

- 128 Analog Switches
- Low  $r_{ON}$
- Guaranteed  $r_{ON}$  Matching
- Analog Signal Input Voltage Equal to the Supply Voltage
- Wide Operating Voltage . . . . . 4V to 15V
- Parallel Input Addressing
- High Latch Up Current . . . . . 50mA (Min)
- Very Low Crosstalk
- Pin and Functionally Compatible with the Following Types: SGS M3494 and Mitel MT8816
- Pb-Free Plus Anneal Available (RoHS Compliant)

**Applications**

- PBX Systems
- Instrumentation
- Analog and Digital Multiplexers
- Video Switching Networks

\*Add "96" suffix for tape and reel.

\*\*Pb-free PDIPs can be used for through hole wave solder processing only. They are not intended for use in Reflow solder processing. applications.

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

To make a connection (close switch) between any two points, specify an "X" address, a "Y" address, set "DATA" high, and switch "STROBE" from low to high. To break a connection, follow this same procedure with "DATA" low.

Example:

To connect switch X3 to switch Y4:

To connect switch X6 to switch Y7:

To break connection from X3 to Y4:

<b>CONTROL</b>				
DATA	38	42		DATA Input determines the state of the addressed switch. A high or one will close the switch. A low or zero will open the switch.
STROBE	18	20		STROBE Input enables the action defined by the DATA and ADDRESS Inputs. A low or zero results in no action. The ADDRESS Input must be stable before the STROBE Input goes to the active high level. The DATA Input must be stable on the falling edge of the STROBE.
RESET	3	3		MASTER RESET. A high or one on this line opens all switches.
CS	36	40	39	CHIP SELECT. Device is selected when CS is at a high level, allows the crosspoint array to be cascaded for matrix expansion.
